(54) Title: **ONE-STEP PROCESS FOR PREPARING CHEWING GUM**

(57) Abstract: A process for preparing a chewing gum wherein all of the gum base components and all of the chewing gum additives are charged, in any appropriate order, into a mixing apparatus and the apparatus operated at atmospheric pressure to obtain the chewing gum, subject to the limitation that the gum base does not contain a vinyl polyester as the sole polymer. In certain embodiments, the gum base comprises at least one environmentally or biodegradable polymer such as a polyester, a polycarbonates, a polyester amide, a polypeptide and a protein.

BEST AVAILABLE COPY

ONE-STEP PROCESS FOR PREPARING CHEWING GUM

FIELD OF THE INVENTION

5 The present invention pertains to the field of manufacturing chewing gum. In particular, there is provided a novel one-step manufacturing process, which is generally applicable for chewing gum formulations. In specific embodiments the present invention provides a method of producing chewing gum containing in the gum base part a degradable or biodegradable polymer.

10

TECHNICAL BACKGROUND AND PRIOR ART

For the most part, current conventional processes for manufacturing chewing gum, including bubble gums, comprise at least two separate steps. In the first process step, 15 a chewing gum base, typically comprising a variety of elastomeric and resinous compounds, is made which, in a second subsequent step, is compounded with various combinations of chewing gum additives such as bulk sweeteners, colouring agents, flavouring agents and other ingredients to obtain the final chewing gum. Generally, the pre-compounded gum base is softened by heating at a temperature in the range of 20 100 to 150°C prior to being admixed with the chewing gum additives.

Conventional chewing gum bases are generally prepared on an industrial scale by heating and mixing the various ingredients such as elastomers, resins, inorganic fillers, waxes, fats, emulsifiers, etc. in an appropriate mixing apparatus such as an 25 open kettle type mixer provided with a heating jacket or other heating means to generate a temperature in the gum base mixture which is the range of 100 to 150°C. The gum base mixing period is generally 2-4 hours per ton of materials.

Evidently, such a prolonged two-step mixing process requires a very high energy 30 consumption and in addition, the separated production of gum base and the subsequent step of compounding the gum base with the remaining chewing gum

ingredients involves substantial amounts of operational handling and the use of a range of processing equipment.

In the art, several attempts have therefore been made to develop one-step chewing
5 gum manufacturing processes comprising compounding all the ingredients, including the gum base ingredients, in one single mixing apparatus so as to avoid the separate gum base processing step.

US patent No. 3,440,060 discloses chewing gum products based on the use therein of
10 certain co- and ter-ethylene vinyl acetate gum base polymers. The chewing gum compositions made with these polymers were made in a one-step mixing operation under undefined conditions. However, because of the poor characteristic physical properties of the applied polymers, and the poor gum formulations used in making the chewing gum products disclosed in this patent, such products have little or no
15 current commercial utility because they are too brittle, and are difficult to process.

US patent No. 4,329,369 discloses a one-step process for preparing chewing gum wherein all materials comprising gum base materials including natural resin, vinyl acetate resin, polyisobutylene, ester gum, emulsifier, filler and others on one hand, as
20 well as chewing gum additives including sucrose, glucose, starch hydrolysate, artificial sweetener, flavour, colorant and others on the other hand were charged into a single mixing apparatus and kneaded simultaneously in a single step, however, under elevated pressure in the range of 4 to 10 kg/cm². Using such a process it was possible to carry out the mixing under the pressure at a temperature in the range of
25 40°C to 60°C and for a period of time in the range of 10 to 15 minutes.

US patent No. 4,968,511 discloses a chewing gum composition comprising, as the sole polymeric component, 5 to 25% by weight of various specific vinyl polyester resin compounds, about 4 to 18% by weight of a plasticizer for the vinyl polyester,
30 about 2 to 11% by weight filler, about 30 to 60% by weight of solid bulk sweetener, about 1 to 25% by weight of liquid bulk sweetener, about 0 to 0.75% by weight of an intense sweetener, about 0.5 to 2.0% by weight of flavouring agent, about 0 to 0.25%

by weight of colouring agent and about 0.5 to 5% by weight of emulsifier, and a process for directly preparing a chewing gum product in a one-step mixing process comprising admixing the listed components at a temperature of about 50 to 100°C at atmospheric pressure for 20-45 minutes.

5

Therefore, it would appear that up till now, no generally applicable process permitting a one-step compounding and mixing of all gum base ingredients and all chewing gum additives has not been available.

- 10 Currently applied gum base elastomeric and resinous materials are generally poorly degradable implying that chewing gum made from such materials gives rise to environmental pollution as used chewing gum will persist under indoor and outdoor environmental conditions for prolonged periods of time. Recently, chewing gum formulations having improved properties with regard to degradability has been
- 15 disclosed, e.g. in US patent No. 5,672,367 where the claimed chewing gum comprises at least one degradable polyester polymer obtained by the polymerisation of cyclic esters, e.g. based on lactides, glycolides, trimethylene carbonate and ϵ -caprolactone. According to this patent, the chewing gum is made from such degradable polymers in a two-step process including the preparation of the gum base,
- 20 melting the gum base and admixing the melted gum base with the chewing gum additives.

The degradable polymers disclosed in the above patent preferably have unstable bonds in the polymer chain, which are prone to be broken hydrolytically or under the

25 influence of light. These characteristics, however, render the polymers susceptible to degradation at elevated temperatures such as at their melting temperatures which are typically in the range of about 50°C to about 100°C.

SUMMARY OF THE INVENTION

30

It has now been found that it is possible to apply one-step processes carried out at atmospheric pressure for manufacturing chewing gum of any conventional

composition to thereby obtain chewing gum products, including such products containing in the chewing gum base one or more biologically or environmentally degradable polymers, having excellent sensory and other quality parameters, which generally exceed those obtained when making similar chewing gum products in a conventional two-step process including a step of melting the gum base. A major object of the present invention is therefore to provide a generally applicable, cost-effective and gentle process for making chewing gum of a high masticatory quality which is retained for extended periods of time, using a single mixing step performed at atmospheric pressure.

10

It is an primary object of the present invention to provide a process for preparing chewing gum which process, relative to conventional processes herefore, is more cost effective and requires less processing equipment.

15

Accordingly, the invention pertains to a process for preparing a chewing gum, the process comprising charging, in an appropriate order, all of the gum base components and all of the chewing gum additives into a mixing apparatus and operating the apparatus at atmospheric pressure to obtain the chewing gum, subject to the limitation that the gum base does not contain a vinyl polyester as the sole functional chewing gum polymer.

20

In certain particularly useful embodiments, the process is one wherein the gum base comprises at least one environmentally degradable or biodegradable polymer such as a polyester, a polycarbonate, a polyester amide, a polypeptide, an amino acid homopolymer or a protein.

25

When applying the one-step process according to the invention, a chewing gum having improved consistence, e.g. so-called volume, softness.

30

One of many features of one embodiment of the invention is that the one-step process relies somewhat more on the mechanical processing of the gum components

than the prior art techniques rather than dedicated heating, e.g. premelting of the gumbase components.

According to a further preferred embodiment of the invention, the heating of the gum
5 base components is primarily provided as a result of the mechanical friction during mixing.

According to the invention, an extremely simple process has been obtained. Not only is the process less time- and manpower consuming, but it also facilitates an improved
10 overall process logistic. This is among other things due to the fact that different parallel and/or serial interdependent mixing processes may be avoided partly or completely, thereby facilitating improved stock management, etc.

Moreover, this improved logistic facilitate an improved traceability in the sense that
15 specific ingredients may be traced in each mix, and in principle to each chewing gum with relatively simple measures..

Moreover, due to the simple measure of the invention, the mixing process may be performed by operators having less skills with respect components heating and
20 pressure management. When operating during almost atmospheric pressure and typically relatively low temperature, great safety improvement has been obtained.

Moreover, when dealing with processing of chewing gum based completely or partly biodegradable polymers, the overall obtainable low process temperature may spare
25 the vulnerable biodegradable polymer, thereby obtaining increased control of the polymer properties.

Moreover, variability of product quality may be reduced due the single step operation.

30

Moreover, manufacturing time will be extremely reduced.

Moreover, the process may be simplified, so that investment cost may be extremely reduced and a significant rationalization may be achieved.

Moreover, the gum base raw materials are never subjected to the high temperature,
5 so that deterioration of quality such as pyrolytic odour and taste may be prevented.

DETAILED DESCRIPTION OF THE INVENTION

5 In the one-step process according to the invention, all of the gum base components and all of the chewing gum additives are initially charged, in an appropriate order, into a mixing apparatus and mixed herein while operating the apparatus at atmospheric pressure to obtain the chewing gum. As used herein, the expression "one-step process" includes a process where two or more gum base components are added to the mixing apparatus in a non-melted or non-heated form.

10

In the context of the present invention, the expression "atmospheric pressure" denotes that the pressure is close to atmospheric pressure. It may be that the pressure is slightly outside the atmospheric pressure. In ranges this may be from 0.90 to 1.10 Pascal, more preferably from 0.95 to 1.05 Pascal. Most preferably the pressure is
15 atmospheric pressure (i.e. 1 Pascal).

In the context of the present invention, the expression "in an appropriate order" implies that all of the components may be added simultaneously or that all or a part of certain components are added first followed by mixing for a selected period of
20 time followed in turn by the addition, under continuous mixing, of all or some of the remaining components or parts thereof until all the components have been loaded into the mixing apparatus.

As used herein, the expressions "gum base component" refers to any component that
25 is conventionally used in the industry to provide the generally water insoluble part of the chewing gum, generally being referred to as the gum base, that determines i.a. the masticatory properties of the final chewing gum product and which typically constitutes 10 to 99% by weight of the total chewing gum formulation. The expression "functional chewing gum polymer" as also used herein refers to a
30 polymeric compound used as a gum base compound as defined herein.

Typically, a chewing gum base formulation comprises one or more elastomeric compounds which may be of synthetic or natural origin, one or more resinous compounds, one or more elastomer plasticizers, fillers, softening compounds and minor amounts of miscellaneous ingredients such as antioxidants and colorants, etc.

5

Useful synthetic elastomers include, but are not limited to, synthetic elastomers listed in Food and Drug Administration, CFR, Title 21, Section 172.615, the Masticatory Substances, Synthetic) such as polyisobutylene. e.g. having a gas pressure chromatography (GPC) average molecular weight in the range of about 10,000 to about 1,000,000 including the range of 50,000 to 80,000, isobutylene-isoprene copolymer (butyl elastomer), styrene-butadiene copolymers e.g. having styrene-butadiene ratios of about 1:3 to about 3:1, polyvinyl acetate (PVA), e.g. having a GPC average molecular weight in the range of 2,000 to about 90,000 such as the range of 3,000 to 80,000 including the range of 30,000 to 50,000, where the higher molecular weight polyvinyl acetates are typically used in bubble gum base, polyisoprene, polyethylene, vinyl acetate-vinyl laurate copolymer e.g. having a vinyl laurate content of about 5 to about 50% by weight such as 10 to 45% by weight of the copolymer, and combinations hereof.

It is common in the industry to combine in a gum base a synthetic elastomer having a high molecular weight and a low-molecular-weight elastomer. Presently preferred combinations of synthetic elastomers include, but are not limited to, polyisobutylene and styrene-butadiene, polyisobutylene and polyisoprene, polyisobutylene and isobutylene-isoprene copolymer (butyl rubber) and a combination of polyisobutylene, styrene-butadiene copolymer and isobutylene isoprene copolymer, and all of the above individual synthetic polymers in admixture with polyvinyl acetate, vinyl acetate-vinyl laurate copolymers, respectively and mixtures thereof.

Particularly interesting elastomeric or resinous polymer compounds which advantageously can be used in a process according to the invention include polymers which, in contrast to currently used elastomers and resins, can be degraded physically, chemically or enzymatically in the environment after use of the chewing

gum, thereby giving rise to less environmental pollution than chewing gums based on non-degradable polymers, as the used degradable chewing gum remnants will eventually disintegrate and/or can be removed more readily by physical or chemical means from the site where it has been dumped.

5

Accordingly, in one preferred embodiment at least one component of the gum base is an environmentally degradable or biodegradable polymer. In the present context, the expression "environmentally degradable or biodegradable polymer" refers to a chewing gum base component which, after dumping the chewing gum, is capable of
10 undergoing a physical, chemical and/or biological degradation whereby the dumped chewing gum waste becomes more readily removable from the site of dumping or is eventually disintegrated to lumps or particles which are no longer recognisable as being chewing gum remnants. The degradation or disintegration of such degradable polymers can be effected or induced by physical factors such as temperature, light,
15 moisture, by chemical factors such as hydrolysis caused by a change in pH or by the action of enzymes capable of degrading the polymers. In other useful embodiments all of the polymer components of the gum base are environmentally degradable or biodegradable polymers.

20 Suitable examples of environmentally or biologically degradable chewing gum base polymers include degradable polyesters, polycarbonates, polyester amides, polypeptides, homopolymers of amino acids such as polylysine, and proteins including derivatives hereof. Particularly useful compounds of this type include polyester polymers obtained by the polymerisation of one or more cyclic esters as
25 disclosed in US patent No. 5,672,367 which is incorporated herein by reference. These polymers include polymers based on one or more cyclic esters selected from lactides, glycolides, trimethylene carbonates and ϵ -caprolactone.

In the present context, useful natural elastomers include the elastomers listed in Food
30 and Drug Administration, CFR, Title 21, Section 172,615, as "Masticatory Substances of Natural Vegetable Origin" including natural rubber compounds such as smoked or liquid latex and guayule and other natural gums including jelutong,

lechi caspi, massaranduba balata, sorva, perillo, rosindinha, massaranduba chocolate, chicle, nispero, gutta hang kang, and combinations thereof. The preferred synthetic elastomer and natural elastomer concentrations vary depending on whether the chewing gum in which the base is used is adhesive or conventional, bubble gum or
5 regular gum, as discussed below. Presently preferred natural elastomers include jelutong, chicle, massaranduba balata and sorva.

In accordance with the invention, the chewing gum base components which are used herein may include one or more resinous compounds contributing to obtain the
10 desired masticatory properties and acting as plasticizers for the elastomers of the gum base composition. In the present context, useful elastomer plasticizers include, but are not limited to, natural rosin esters, often referred to as ester gums including as examples glycerol esters of partially hydrogenated rosins, glycerol esters of polymerised rosins, glycerol esters of partially dimerised rosins, glycerol esters of
15 tally oil rosins, pentaerythritol esters of partially hydrogenated rosins, methyl esters of rosins, partially hydrogenated methyl esters of rosins and pentaerythritol esters of rosins. Other useful resinous compounds include synthetic resins such as terpene resins derived from alpha-pinene, beta-pinene, and/or d-limonene, natural terpene resins; and any suitable combinations of the foregoing. The choice of elastomer
20 plasticizers will vary depending on the specific application, and on the type of elastomer(s) being used.

A chewing gum base formulation may, if desired, include one or more fillers/texturisers including as examples, magnesium and calcium carbonate, sodium
25 sulphate, ground limestone, silicate compounds such as magnesium and aluminium silicate, kaolin and clay, aluminium oxide, silicium oxide, talc, titanium oxide, mono-, di- and tri-calcium phosphates, cellulose polymers, such as wood, and combinations thereof.

30 The fillers/texturisers may also include natural organic fibres such as fruit vegetable fibres, grain, rice, cellulose and combinations thereof.

A gum base formulation may, in accordance with the present invention comprise one or more softeners e.g. sucrose polyesters including those disclosed in WO 00/25598, which is incorporated herein by reference, tallow, hydrogenated fat including tallow,
5 hydrogenated and partially hydrogenated vegetable oils, cocoa butter, glycerol monostearate, glycerol triacetate, lecithin, mono-, di- and triglycerides, acetylated monoglycerides, fatty acids (e.g. stearic, palmitic, oleic and linoleic acids), and combinations thereof. As used herein the term "softener" designates an ingredient, which softens the gum base or chewing gum formulation and encompasses waxes,
10 fats, oils, emulsifiers, surfactants and solubilisers.

To soften the gum base further and to provide it with water binding properties, which confer to the gum base a pleasant smooth surface and reduce its adhesive properties, one or more emulsifiers is/are usually added to the composition, typically in an
15 amount of 0 to 18% by weight, preferably 0 to 12% by weight of the gum base. Mono- and diglycerides of edible fatty acids, lactic acid esters and acetic acid esters of mono and diglycerides of edible fatty acids, acetylated mono and diglycerides, sugar esters of edible fatty acids, Na-, K-, Mg- and Ca-stearates, lecithin, hydroxylated lecithin and the like are examples of conventionally used emulsifiers
20 which can be added to the chewing gum base. In case of the presence of a biologically or pharmaceutically active ingredient as defined below, the formulation may comprise certain specific emulsifiers and/or solubilisers in order to enhance dispersion and release of the active ingredient.

25 Waxes and fats are conventionally used for the adjustment of the consistency and for softening of the chewing gum base when preparing chewing gum bases. In connection with the present invention, any conventionally used and suitable type of wax and fat may be used, such as for instance rice bran wax, polyethylene wax, petroleum wax (refined paraffin and microcrystalline wax), paraffin, bees' wax,
30 carnauba wax, candelilla wax, cocoa butter, degreased cocoa powder and any suitable oil or fat, as e.g. completely or partially hydrogenated vegetable oils or completely or partially hydrogenated animal fats.

In a further embodiment of the present invention the gum base is wax free.

Furthermore, the gum base formulation may, in accordance with the present invention, comprise colorants and whiteners such as FD&C-type dyes and lakes, fruit and vegetable extracts, titanium dioxide and combinations thereof. Further useful chewing gum base components include antioxidants, e.g. butylated hydroxytoluene (BHT), butyl hydroxyanisol (BHA), propylgallate and tocopherols, and preservatives.

10

The composition of chewing gum base formulations which in the present one-step process are admixed with chewing gum additives as defined below can vary substantially depending on the particular product to be prepared and on the desired masticatory and other sensory characteristics of the final product. However, typical ranges (% by weight) of the above gum base components are: 5 to 100% elastomeric compounds, 5 to 55% elastomer plasticizer, 0 to 50% filler/texturiser, 5 to 35% softener and 0 to 1% of miscellaneous ingredients such as antioxidants, colorants, etc.

20 In accordance with the invention, the one-step process involves that gum base components as described above are loaded into a mixing apparatus with chewing gum additives. In the present context, the term "chewing gum additive" is used to designate any component, which in a conventional two-step process is added to the separately produced and pre-melted or -heated gum base. The major proportion of such conventionally used additives are water soluble, but water-insoluble components, such as e.g. water-insoluble flavouring compounds, can also be included.

30 In the present context, chewing gum additives include bulk sweeteners, high intensity sweeteners, flavouring agents, softeners, emulsifiers, colouring agents, binding agents, acidulants, fillers, antioxidants and other components such as

pharmaceutically or biologically active substances, that confer desired properties to the finished chewing gum product.

Suitable bulk sweeteners include both sugar and non-sugar components. Bulk
5 sweeteners typically constitute from about 5 to about 95% by weight of the chewing gum, more typically about 20 to about 80% by weight such as 30 to 60% by weight of the gum.

Useful sugar sweeteners are saccharide-containing components commonly known in
10 the chewing gum art including, but not limited to, sucrose, dextrose, maltose, dextrins, trehalose, D-tagatose, dried invert sugar, fructose, levulose, galactose, corn syrup solids, and the like, alone or in combination.

Sorbitol can be used as a non-sugar sweetener. Other useful non-sugar sweeteners
15 include, but are not limited to, other sugar alcohols such as mannitol, xylitol, hydrogenated starch hydrolysates, maltitol, isomaltol, erythritol, lactitol and the like, alone or in combination.

High intensity artificial sweetening agents can also be used alone or in combination
20 with the above sweeteners. Preferred high intensity sweeteners include, but are not limited to sucralose, aspartame, salts of acesulfame, alitame, saccharin and its salts, cyclamic acid and its salts, glycyrrhizin, dihydrochalcones, thaumatin, monellin, sterioside and the like, alone or in combination. In order to provide longer lasting sweetness and flavour perception, it may be desirable to encapsulate or otherwise
25 control the release of at least a portion of the artificial sweetener. Techniques such as wet granulation, wax granulation, spray drying, spray chilling, fluid bed coating, coascervation, encapsulation in yeast cells and fibre extrusion may be used to achieve desired release characteristics. Encapsulation of sweetening agents can also be provided e.g. using as the encapsulation agent another chewing gum component
30 such as a resinous compound.

Usage level of the artificial sweetener will vary considerably depending e.g. on factors such as potency of the sweetener, rate of release, desired sweetness of the product, level and type of flavour used and cost considerations. Thus, the active level of artificial sweetener may vary from about 0.02 to about 8% by weight. When
5 carriers used for encapsulation are included, the usage level of the encapsulated sweetener will be proportionately higher. Combinations of sugar and/or non-sugar sweeteners can be used in the chewing gum formulation processed in accordance with the invention. Additionally, the softener may also provide additional sweetness such as with aqueous sugar or alditol solutions.

10

If a low calorie gum is desired, a low caloric bulking agent can be used. Examples of low caloric bulking agents include polydextrose, Raftilose, Raftilin, fructooligosaccharides (NutraFlora[®]), palatinose oligosaccharides; guar gum hydrolysates (e.g. Sun Fiber[®]) or indigestible dextrins (e.g. Fibersol[®]). However,
15 other low calorie-bulking agents can be used.

Further chewing gum additives which may be included in the chewing gum mixture processed in the present process include surfactants and/or solubilisers, especially when pharmaceutically, cosmetically or biologically active ingredients are present.
20 As examples of types of surfactants to be used as solubilisers in a chewing gum composition according to the invention reference is made to H.P. Fiedler, Lexikon der Hilfsstoffe für Pharmacie, Kosmetik und Angrenzende Gebiete, page 63-64 (1981) and the lists of approved food emulsifiers of the individual countries. Anionic, cationic, amphoteric or non-ionic solubilisers can be used. Suitable
25 solubilisers include lecithins, polyoxyethylene stearate, polyoxyethylene sorbitan fatty acid esters, fatty acid salts, mono and diacetyl tartaric acid esters of mono and diglycerides of edible fatty acids, citric acid esters of mono and diglycerides of edible fatty acids, saccharose esters of fatty acids, polyglycerol esters of fatty acids, polyglycerol esters of interesterified castor oil acid (E476), sodium stearyl-lactylate,
30 sodium lauryl sulfate and sorbitan esters of fatty acids and polyoxyethylated hydrogenated castor oil (e.g. the product sold under the trade name CREMOPHOR), block copolymers of ethylene oxide and propylene oxide (e.g. products sold under

trade names PLURONIC and POLOXAMER), polyoxyethylene fatty alcohol ethers, polyoxyethylene sorbitan fatty acid esters, sorbitan esters of fatty acids and polyoxyethylene stearic acid esters.

- 5 Particularly suitable solubilisers are polyoxyethylene stearates, such as for instance polyoxyethylene(8)stearate and polyoxyethylene(40)stearate, the polyoxyethylene sorbitan fatty acid esters sold under the trade name TWEEN, for instance TWEEN 20 (monolaurate), TWEEN 80 (monooleate), TWEEN 40 (monopalmitate), TWEEN 60 (monostearate) or TWEEN 65 (tristearate), mono and diacetyl tartaric acid esters
10 of mono and diglycerides of edible fatty acids, citric acid esters of mono and diglycerides of edible fatty acids, sodium stearylactylate, sodium laurylsulfate, polyoxyethylated hydrogenated castor oil, blockcopolymers of ethylene oxide and propyleneoxide and polyoxyethylene fatty alcohol ether. The solubiliser may either be a single compound or a combination of several compounds. The expression
15 "solubiliser" is used in the present text to describe both possibilities, the solubiliser used must be suitable for use in food and/or medicine.

In the presence of an active ingredient the chewing gum may preferably also comprise a carrier known in the art.

20

- One significant advantage of the present one-step mixing process is that the temperature throughout the entire operation can be kept at a relatively low level such as it will be described in the following. This is an advantageous feature with regard to preserving the aroma of added flavouring components which may be prone to
25 deterioration at higher temperatures. Aroma agents and flavouring agents which are useful in a chewing gum produced by the present process are e.g. natural and synthetic flavourings (including natural flavourings) in the form of freeze-dried natural vegetable components, essential oils, essences, extracts, powders, including acids and other substances capable of affecting the taste profile. Examples of liquid
30 and powdered flavourings include coconut, coffee, chocolate, vanilla, grape fruit, orange, lime, menthol, liquorice, caramel aroma, honey aroma, peanut, walnut, cashew, hazelnut, almonds, pineapple, strawberry, raspberry, tropical fruits, cherries,

cinnamon, peppermint, wintergreen, spearmint, eucalyptus, and mint, fruit essence such as from apple, pear, peach, strawberry, apricot, raspberry, cherry, pineapple, and plum essence. The essential oils include peppermint, spearmint, menthol, eucalyptus, clove oil, bay oil, anise, thyme, cedar leaf oil, nutmeg, and oils of the
5 fruits mentioned above.

In one preferred embodiment, the flavour is one or more natural flavouring agent(s) which is/are freeze-dried, preferably in the form of a powder, slices or pieces of combinations thereof. The particle size of such agent may be less than 3 mm, such as
10 less than 2 mm, more preferred less than 1 mm, calculated as the longest dimension of the particle. The natural flavouring agent may also be in a form where the particle size is from about 3 μ m to 2 mm, such as from 4 μ m to 1 mm. Preferred natural flavouring agents include seeds from a fruit e.g. from strawberry, blackberry and raspberry.

15

Various synthetic flavours, such as mixed fruit flavour may also be used according to the present invention. As indicated above, the aroma agent may be used in quantities smaller than those conventionally used. The aroma agents and/or flavours may be used in an amount of from 0.01 to about 30% by weight of the final product
20 depending on the desired intensity of the aroma and/or flavour used. Preferably, the content of aroma/flavour is in the range of from 0.2 to 3% by weight of the total composition.

In one embodiment the chewing gum composition processed in a one-step operation
25 according to the invention comprises a pharmaceutically, cosmetically or biologically active substance. Examples of such active substances, a comprehensive list of which is found e.g. in WO 00/25598, which is incorporated herein by reference, include drugs, dietary supplements, antiseptic agents, pH adjusting agents, anti-smoking agents (e.g. nicotine) and substances for the care or treatment of the
30 oral cavity and the teeth such as hydrogen peroxide and compounds capable of releasing urea during chewing. Examples of useful active substances in the form of antiseptics include salts and derivatives of guanidine and biguanidine (for instance

chlorhexidine diacetate) and the following types of substances with limited water-solubility: quaternary ammonium compounds (e.g. ceraminate, chloroxylenol, crystal violet, chloramine), aldehydes (e.g. paraformaldehyde), derivatives of dequaline, polynoxyline, phenols (e.g. thymol, *p*-chlorophenol, cresol), hexachlorophene, salicylic anilide compounds, triclosan, halogenes (iodine, iodophores, chloramine, dichlorocyanuric acid salts), alcohols (3,4 dichlorobenzyl alcohol, benzyl alcohol, phenoxyethanol, phenylethanol), cf. also Martindale, The Extra Pharmacopoeia, 28th edition, page 547-578; metal salts, complexes and compounds with limited water-solubility, such as aluminium salts, (for instance aluminium potassium sulphate $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$) and salts, complexes and compounds of boron, barium, strontium, iron, calcium, zinc, (zinc acetate, zinc chloride, zinc gluconate), copper (copper chloride, copper sulphate), lead, silver, magnesium, sodium, potassium, lithium, molybdenum, vanadium should be included; other compositions for the care of mouth and teeth: for instance; salts, complexes and compounds containing fluorine (such as sodium fluoride, sodium monofluorophosphate, aminofluorides, stannous fluoride), phosphates, carbonates and selenium. Further active substances can be found in J. Dent.Res. Vol. 28 No. 2, page 160-171, 1949.

Examples of active substances in the form of agents adjusting the pH in the oral cavity include: acids, such as adipinic acid, succinic acid, fumaric acid, or salts thereof or salts of citric acid, tartaric acid, malic acid, acetic acid, lactic acid, phosphoric acid and glutaric acid and acceptable bases, such as carbonates, hydrogen carbonates, phosphates, sulphates or oxides of sodium, potassium, ammonium, magnesium or calcium, especially magnesium and calcium.

25

In accordance with the invention, the present one-step process comprises, subsequent to or during the step of charging, in any appropriate order, all of the gum base components and all of the chewing gum additives into a mixing apparatus, a step of operating the apparatus under atmospheric pressure conditions to obtain the chewing gum. In general terms, a typical one-step batch mixing operation is carried out as described in the following:

30

All of the chewing gum components selected for the particular type of chewing gum to be processed are mixed thoroughly in any conventional type of kneading or mixing vessel such as e.g. a kettle provided with mixing means such as e.g. horizontally placed Z-shaped arms, which are capable of intimately mixing the selected chewing gum components to produce a homogeneous chewing gum mass. It is also possible to carry out a batchwise one-step processing of the chewing gum using a shear stress generating apparatus including an extruder apparatus. Preferably, the mixing vessel is provided with heating means such as a heating jacket permitting hot water, oil or steam to be circulated around the mixing space, or heating elements. Generally, the temperature is set initially at a temperature in the range of 30-80°C, the preferred temperature depending e.g. on the temperature at which the selected elastomeric or resinous polymers become sufficiently soft to be processed. A typical initial mixing temperature is in the range of 40 to 65°C such as the range of 45 to 60°C. It is preferred that the temperature does not rise substantially during the mixing operation, e.g. not more than 5-20°C. In preferred embodiments, the temperature does not exceed about 60°C at any point in time during the batch mixing process.

Typically, the mixing process starts with mixing of the gum base components in the quantities that have been weighed out, and the processing of these components continues for 1-30 minutes, such as 5-20 including about 10 minutes following which the sweetening component(s) in powder form or in liquid form is/are added. Typically, the time period for dosing of sweeteners and the subsequent processing is in the range of 1 to 20 minutes such as in the range 2 to 15 minutes, e.g. about 7 minutes. When polymers of a high molecular weight is used, it may be required to extend the mixing period to e.g. up to 40 minutes, optionally while cooling the mixing space of the mixing apparatus.

However, it should be noted that the mixing step may be extended to a certain degree in time when applying conventional non-degradable gum base raw materials.

30

The flavours and the remaining chewing gum components are typically added to the mixing apparatus still being continuously operated following the addition of

sweetener and mixing hereof into the gum base component, and mixing is continued for a further 1 to 10 minutes, such as 2 to 8 minutes, typically about 5 minutes. The admixture of flavours and the remaining components may also take place in the beginning of the kneading process, i.e. before the admixture of the sweeteners. It is
5 also possible to add the selected amount of flavours in two or more rounds throughout the kneading/mixing process. It is preferred that the total mixing step is completed within 30 minutes such as within 20 minutes or even within 15 minutes of operation.

- 10 However, it should be noted that the mixing step may be extended to a certain degree in time when applying conventional non-degradable gum base raw materials.

In a further embodiment, the invention for manufacturing conventional chewing gum comprising the step of adding softening system together with low molecular weight
15 polymers. The processing of these components continues for 1-30 minutes, such as 5-20 including about 8 minutes following which high molecular weight polymers and fillers are added. Typically, the time period for dosing and subsequent processing is in the range of 1-10 minutes, such as 2 to 8, typically about 5 minutes. All resins and sweetening powder form are added, and the processing continues for 10-60 minutes,
20 such as 20-40 including about 30 minutes.

The flavours and the remaining chewing gum components are typically added to the mixing apparatus still being continuously operated following the addition of sweetener and mixing hereof into the gum base component, and mixing is continued
25 for a further 1 to 30 minutes, such as 10 to 20 minutes, typically about 15 minutes.

When the kneading/mixing step is completed, the resulting chewing gum mass is recovered from the mixing vessel and e.g. transferred to a cart, tray or the like as it is conventional in industrial chewing gum manufacturing and the gum mass is
30 processed further into finished chewing gum products using conventional steps herefor which are generally known in the art including forming of the chewing gum

into cores, sticks, balls, cubes, cylinders and any other desired shape, optionally followed by coating and polishing processes prior to packaging.

Whereas the above description of the process according to the invention refers particularly to a batch process, it is also within the scope of the invention to carry out the one-step mixing process as a continuous process where shear stress is applied to the gum base and additive mixture e.g. using a screw type mixer which can be of the single oscillating or double co-rotating auger types including an extruder of the Buss type. As it is the case with a batch one-step process, the temperature is controlled in a continuous mixing operation so as to secure sufficient softening of the gum base polymers, but without reaching a temperature that may damage the polymers or any other component that is heat sensitive. Thus, the temperature in the mixing chamber of the screw type mixer is preferably within the range of 40 to 80°C such as in the range of 50 to 70°C throughout the entire mixing operation. In preferred embodiments, the temperature does not exceed about 60°C during the continuous mixing operation.

The invention will now be described in the following, non-limiting examples and the drawings wherein

15

EXAMPLE 1

20 Preparation of chewing gum with peppermint taste containing degradable gum base polymers using a conventional two-step process wherein the gum base is melted prior to mixing (reference test)

In this example, a degradable polymer as defined in US 5,672,367 and obtained by polymerisation of cyclic esters and having unstable bonds that can be broken hydrolytically or under the influence of light, was used as the gum base part. In the following, the polymer is designated as BDP1. Prior to mixing with the chewing additives as listed below, the gum base polymer was softened/melted in a 100 °C water bath for 30 minutes.

25
30

The pre-melted gum base was charged together with about one third of the amount of sorbitol into a conventional double sigma blade mixer (Krupp, Werner & Pfleiderer

GmbH, Germany) provided with two blades inside the kettle bowl, each in the shape of the letter "Z", the velocity of which can be set at a velocity in the range of 1 to 110 rpm. In this experiment, the double blade mixer was set at a rotation of 50 rpm. Subsequently, the remaining chewing gum additives as listed in the below Table 1 was added under mixing conditions at the indicated points in time. The composition of the chewing gum formulation and the mixing conditions are summarised in the below Table 1:

Table 1. Composition of chewing gum with pre-melted degradable gum base polymer BDP1, and mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
BDP1	40.46	0	60
Sorbitol powder	13.26	0	60
Lecithin	0.20	2	58
Lycasine	5.77	2	58
Sorbitol powder	13.46	2	58
Sorbitol powder	13.46	4	55
Peppermint	1.54	6	56
Menthol (crystal)	0.31	6	56
Menthol powder	0.37	7	58
Peppermint powder	0.19	7	58
Menthol powder	0.19	7	58
Aspartame	0.19	8	58
Acesulfame	0.1	8	58
Xylitol	10.8	10	58
Total	100.0	12	58

EXAMPLE 2

Preparation of chewing gum with peppermint taste containing degradable gum base polymers using a conventional two-step process wherein the gum base is melted prior to mixing (reference test)

- 5 In this example, a chewing gum was prepared essentially as described in Example 1, however, with the modification that a different pre-melted degradable polymer, designated BDP2. The composition and the mixing conditions were as listed in the below Table 2:

10 Table 2. Composition of chewing gum with pre-melted degradable gum base polymer BDP2, and mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
BDP2	40.46	0	63
Sorbitol powder	13.26	0	63
Lecithin	0.20	2	63
Lycasine	5.77	2	63
Sorbitol powder	13.46	2	63
Sorbitol powder	13.46	4	63
Peppermint	1.54	6	63
Menthol (crystal)	0.31	6	63
Menthol powder	0.37	7	61
Peppermint powder	0.19	7	61
Menthol powder	0.19	7	61
Aspartame	0.19	8	59
Acesulfame	0.1	8	59
Xylitol	10.8	10	61
Total	100.0	12	58

EXAMPLE 3

Preparation of chewing gum with peppermint taste containing non-degradable polymers using a one-step mixing process according to the invention

5

In this example, the step of pre-melting the gum base was omitted implying that a conventional gum base designated Gum base A was added directly, i.e. without pre-melting, to the mixing apparatus used in Examples 1-2 and mixed with the chewing gum additives as listed in the below Table 3 at the indicated points in time.

10

Table 3. Composition of chewing gum with non-degradable gum base A, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp ¹ (°C)
Gum base A	40.46	0	25
Sorbitol powder	13.26	0	25
Lecithin	0.20	2	38
Lycasine	5.77	2	38
Sorbitol powder	13.46	4	42
Sorbitol powder	13.46	5	42
Peppermint	1.54	6	43
Menthol (crystal)	0.31	6	43
Menthol powder	0.37	7	45
Peppermint powder	0.19	7	45
Menthol powder	0.19	7	45
Aspartame	0.19	8	45
Acesulfame	0.1	8	45
Xylitol	10.8	10	46
Total	100.0	12	48

¹Temperature measured manually in the chewing gum mass before adding new ingredients

As it appears, it was possible to obtain the final chewing gum using a one-step mixing process within a time period of 12 minutes.

EXAMPLE 4

Preparation of chewing gum with peppermint taste containing as the gum base part non-degradable polymers using a one-step mixing process according to the invention

The one-step process of Example 3 was used to prepare another chewing gum comprising as the gum base part, the components of the gum base designated gum base B. The composition and the mixing conditions were as listed in the below Table 4:

Table 4. Composition of chewing gum with non-degradable gum base B, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
Gum base B	40.46	0	25
Sorbitol powder	13.26	0	25
Lecithin	0.20	2	38
Lycasine	5.77	2	38
Sorbitol powder	13.46	4	42
Sorbitol powder	13.46	5	43
Peppermint	1.54	6	44
Menthol (crystal)	0.31	6	44
Menthol powder	0.37	7	46
Peppermint powder	0.19	7	46

Menthol powder	0.19	7	46
Aspartame	0.19	8	46
Acesulfame	0.1	8	46
Xylitol	10.8	10	47
Total	100.0	12	48

Also with this non-degradable gum base admixed in a non-melted state it was possible to obtain the final chewing gum using a one-step mixing process within a mixing period of 12 minutes.

5

EXAMPLE 5

Preparation of chewing gum with peppermint taste containing as the gum base part degradable polymers using a one-step mixing process according to the invention

10

The one-step process used in this test was essentially as in Example 4 with the modification, however, that the gum base part was the environmentally degradable polyester polymer designated BDP1 as used in Example 1. The composition and the mixing conditions were as listed in the below Table 5:

15

Table 5. Composition of chewing gum with degradable gum base polymer BDP1, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
Gum base polymer BDP1	40.46	0	25
Sorbitol powder	13.26	0	25
Lecithin	0.20	2	43
Lycasine	5.77	2	43
Sorbitol powder	13.46	2	43

Sorbitol powder	13.46	3	48
Peppermint	1.54	4	51
Menthol (crystal)	0.31	4	51
Menthol powder	0.37	5	51
Peppermint powder	0.19	5	51
Menthol powder	0.19	5	51
Aspartame	0.19	6	51
Acesulfame	0.1	6	51
Xylitol	10.8	8	53
Total	100.0	10	53

As it appears, it was possible to mix all of the chewing gum components in a one-step

- mixing process within the same time period as in the corresponding reference two-step process of Example 1 and without reaching a higher temperature in the final chewing gum mass. Indeed, the final temperature in the final chewing gum mass was significantly lower when using a one-step process.

EXAMPLE 6

10

Preparation of chewing gum with peppermint taste containing as the gum base part degradable polymers using a one-step mixing process according to the invention

- 15 The one-step process used in this Example was essentially as that of Example 5 with the modification, however, that the gum base part was a different environmentally degradable polyester polymer designated BDP2 and having the same basic characteristics as the polymer used in Example 5. The composition and the mixing conditions were as listed in the below Table 6:

20

Table 6. Composition of chewing gum with degradable gum base polymer BDP2, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
Gum base polymer BDP2	40.46	0	25
Sorbitol powder	13.26	0	25
Lecithin	0.20	2	38
Lycasine	5.77	2	38
Sorbitol powder	13.46	2	43
Sorbitol powder	13.46	3	50
Peppermint	1.54	4	50
Menthol (crystal)	0.31	4	50
Menthol powder	0.37	5	50
Peppermint powder	0.19	5	50
Menthol powder	0.19	5	50
Aspartame	0.19	6	50
Acesulfame	0.1	6	50
Xylitol	10.8	8	54
Total	100.0	10	54

- 5 The mixing time required and the final chewing gum mass temperature were essentially as those obtained for degradable polymer BDP1 when used in a one-step process.

EXAMPLE 7

10

Preparation of chewing gum with peppermint taste containing as the gum base part a mixture of degradable polymers using a one-step mixing process according to the invention

The chewing gum in this example was prepared essentially as described in Examples 5 or 6, however with the modification that equal amounts of degradable polymer BDP1 and degradable polymer BDP2, respectively was used as the gum base part instead of either of the individual degradable polymers. The composition and the mixing conditions were as listed in the below Table 7:

Table 7. Composition of chewing gum with equal amounts of degradable gum base polymers BDP1 and BDP2, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
Gum base polymer BDP1	20.23	0	25
Gum base polymer BDP2	20.23	0	25
Sorbitol powder	13.26	0	25
Lecithin	0.20	2	35
Lycasine	5.77	2	35
Sorbitol powder	13.46	2	35
Sorbitol powder	13.46	3	48
Peppermint	1.54	4	50
Menthol (crystal)	0.31	4	50
Menthol powder	0.37	5	53
Peppermint powder	0.19	5	53
Menthol powder	0.19	5	53
Aspartame	0.19	6	53
Acesulfame	0.1	6	53
Xylitol	10.8	8	53
Total	100.0	10	52

The mixing time required and the final chewing gum mass temperature were essentially as those obtained when using either of degradable polymers BDP1 and BDP2 separately.

5 EXAMPLE 8

Preparation of chewing gum with peppermint taste using as the gum base a mixture of non-degradable and degradable polymers applying a one-step mixing process wherein all of the gum base components are loaded separately to
10 the mixing apparatus

In this Example, the gum base part consisted of both a mixture of non-degradable polymers, i.e. polyisobutylene, polyvinyl acetate having low molecular weight and an ester gum, and degradable polymer BDP1. Each of these chewing gum base
15 components was added separately to the mixing apparatus used in the previous Examples at the points in time indicated in table 8 below:

Table 8. Composition of chewing gum with a gum base mixture of non-degradable gum base polymers added separately and the degradable gum base polymer BDP1, and one-step mixing conditions
20

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
Gum base polymer BDP1	12.40	0	35
Polyisobutylene	4.10	0	35
Talc	5.00	0	35
Polyvinyl acetate, LW	6.20	0	35
Ester gum	4.35	1	35
Monodiglycerides	3.75	2	48
Hydrogenated fat	5.10	2	48
Sorbitol powder	13.26	2	48

32

Lecithin	0.20	3	52
Lycasine	5.77	3	52
Sorbitol powder	13.42	3	52
Sorbitol powder	13.42	4	53
Peppermint	1.54	5	54
Menthol (crystal)	0.31	5	54
Menthol powder	0.37	6	54
Peppermint powder	0.19	6	54
Menthol powder	0.19	6	54
Aspartame	0.19	7	54
Acesulfame	0.10	7	54
Xylitol	10.78	8	54
Total	100.0	10	54

As it appears, it is possible to provide a one-step chewing gum mixing process wherein a range of non-degradable gum base polymers and degradable polymers are added separately in the process and obtain the finished chewing mass within a very short period of time.

EXAMPLE 9

- 10 **Preparation of chewing gum with peppermint taste containing as the gum base part degradable polymers using a one-step mixing process according to the invention**

15 The one-step process used in this test was essentially as in Example 5 with the modification, however, a smaller amount of the degradable gum base polymer was used and the omitted amount replaced by a filler and hydrogenated fat. The composition and the mixing conditions were as listed in the below Table 9 summarising the composition and the mixing conditions:

Table 9. Composition of chewing gum with degradable gum base polymer BDP1, and one-step mixing conditions

Ingredient	Parts (weight)	Time (min.)	Temp (°C)
BDP 1	30.46	0	28
Sorbitol powder	13.26	0	28
Filler	5.0	1	38
Hydrogenated fat	5.0	1	38
Sorbitol powder	13.46	1	38
Lecithin	0.20	3	41
Lycasine	5.77	3	41
Sorbitol powder	13.46	3	41
Peppermint	1.54	5	43
Menthol (crystal)	0.31	5	43
Menthol powder	0.37	6	46
Peppermint powder	0.19	6	46
Menthol powder	0.19	6	46
Aspartame	0.19	7	46
Acesulfame	0.1	7	46
Xylitol	10.8	8	46
Total	100.0	10	46

5

EXAMPLE 10

Sensory profile analyses of test chewing gum

- 10 The following chewing gums were tested by a sensory panel of 5 panellists extensively trained in sensory testings of chewing gum: (i) the chewing gum of

Example 4, i.e. a chewing gum made in a one-step process using the gum base designated herein as gum base B, (ii) the chewing gum of Example 7, i.e. a chewing prepared using a one-step process with an equal mixture of degradable polymers BDP1 and BDP2, (iii) the chewing gum of Example 2, i.e. a chewing gum prepared
5 in a two-step process using as the gum base pre-melted degradable polymer BDP2 and (iv) the chewing gum of Example 6, i.e. a chewing gum prepared in a one-step process according to the invention, using non-melted degradable polymer BDP2.

The samples of chewing gum was tested by serving them to the sensory panellists in
10 tasting booths made in accordance with ISO 8598 standards at room temperature in 40 ml tasteless plastic cups with randomised 3-figure codes. Test samples were evaluated after chewing for 0-1 minutes (initial phase), 2-3 minutes (intermediate phase) and 4-5 minutes (end phase), respectively. Between each sample tested, the panellists were allowed a brake of 3 minutes.

15

The following standard parameters were assessed: Mint flavour, crumble ness, tacking to teeth, initial softness, volume, creakiness, softness, sweetness, cooling effect, juiciness, smoothness and elasticity. For each of these parameters, the panellists were required to provide their assessments according to an arbitrary scale
20 of 0-15. The data obtained were processed using a FIZZ computer program (French Bio System) and the results were transformed to sensory profile diagrams as shown in Figures 1-6. Additionally, the sensory profile test data were subjected to statistical analyses, the results of which are summarised in Tables 10-12 below.

25 The major differences between test chewing gums in the initial testing phase were the following:

Chewing gums prepared by a one-step process according to the invention showed a significantly higher softness than corresponding chewing gums prepared in a
30 conventional two-step process, i.e. including a pre-melting step of the gum base.

Chewing gum prepared using a one-step according to the invention had a significantly larger volume than corresponding chewing gum prepared in a conventional two-step process.

- 5 The major differences between test chewing gums in the intermediate testing phase were the following:

Chewing gums prepared using the one-step process of the invention showed significantly less tacking to teeth, were significantly softer and had a significantly
10 larger volume than gums prepared in a conventional two-step process.

Testing in the end phase did not reveal statistically significant differences between samples, but as it appears from figures 3 and 6, the samples prepared using the present one-step process had a higher softness and a larger volume.

15

It can therefore be concluded that the use of a one-step chewing gum process without a separate gum base preparation and/or a pre-melting step prior to admixture with the chewing gum additives results in final chewing gum products that, relative to chewing gum processed in two separate mixing steps, are superior with regard to
20 essential sensory characteristics.

Table 10. Statistical analyses of sensory profile analyses of test chewing gums, initial phase

EXAMPLE 11

10 **Reduced hardness of chewing gums prepared by a one-step process of the invention**

It is generally desirable that the masticatory feeling of hardness in a chewing gum body is not too high. It was therefore decided to test the effect on hardness of the final chewing gum prepared using the present one-step process using chewing gum of the same composition, but prepared using a conventional two-step process as references.

15

The following chewing gums were included in this testing: (i) the chewing gum of Example 2 herein (BDP2, premelted) and (ii) the chewing gum of Example 6 herein (BDP2, one-step).

- 5 The hardness of the test samples were tested by a compression load test using an Instron instrument with a 4 mm DIA CYLINDER STAINLESS at a speed of 25 mm/min. using a test distance of 3.5 mm into the chewing gum body. The results (N) are summarised in Figure 7. As it appears, the test chewing gum sample prepared using the one-step process of the present invention showed substantially reduced
10 hardness over the conventionally produced chewing gums.

EXAMPLE 12

- In this experiment, the rheological properties (storage modulus, G') was determined
15 using a rheometer, type AR1000 from AT Instruments for the chewing gums made in Example 6 (with degradable gum base polymer BDP2, one-step), Example 2 (with pre-melted degradable gum base polymer BDP2, i.e. a two-step process) and a chewing gum comprising non-degradable gum base polymer B and made by a conventional two-step process wherein the gum base is pre-melted prior to admixing
20 with chewing gum additives. The oscillation measurement is performed at a stress within the linear viscoelastic region and a temperature of 70 °C with a parallel plate system ($d=2,0$ cm, hatched).

- The results are summarised in Fig. 8 and, as it appears, the elasticity of the chewing
25 gum made in accordance with the present invention was improved as compared to the chewing gum made by using pre-melted gum bases and it had elasticity characteristics which were closer to those of the chewing gum made from a non-degradable polymer than the one made by using a degradable polymer.

30 EXAMPLE 13

Preparation of chewing gum with peppermint taste using conventional gum base formulations applying a one-step mixing process wherein all of the gum base and chewing gum components are loaded separately to the mixing apparatus

5

In this Example, different conventional gum base formulations was used to make one step chewing gum formulations. Each of these gum base components was added separately to the mixing apparatus used in the previous Examples. The composition and mixing conditions were as listed in the below Table 13:

10

Table 13. Composition of chewing gum with conventional gum base components and one-step mixing conditions.

ONE-STEP PROCESS	CG 1 -1010	CG 2 -1008	CG 3 -1009	CG 4 -1011	CG 5 -1542	CG 6 -1541

I: Conventional gum base process, II: conventional chewing gum process

Also with different conventional gum base formulations added separately it was possible to obtain the final chewing gum using a one-step mixing process with significant reduced process time and without reaching a higher temperature as in the
5 second step of a conventional two-step processes.

EXAMPLE 14

In this experiment, the rheological properties (storage modulus, G') was determined
10 using a rheometer, type AR1000 from AT Instruments for the chewing gums made in Example 13. The oscillation measurement is performed at a stress within the linear viscoelastic region and a temperature of 70 °C with a parallel plate system ($d=2,0$ cm, hatched).

15 The results are summarised in Fig. 9 and Fig. 10, as it appears, the rheological properties of the chewing gum made in accordance with the present invention are similar as compared to the chewing gum made by conventional two-step process.

EXAMPLE 15

20

Sensory profile analyses of test chewing gum

The following chewing gums were tested by a sensory panel of 5 panellists extensively trained in sensory testings of chewing gum: the chewing gum of
25 Example 13, i.e. a chewing gum made in a one-step process designated herein as CG 1, and the same chewing gum formulation prepared in a conventional two-step process designated as CG 7.

The samples of chewing gum was tested under same conditions described in
30 Example 10.

The following standard parameters were assessed: Flavour impact, flavour intensity, peppermint, tacking to teeth, initial softness, volume, creakiness, softness, sweetness, cooling effect and elasticity.

- 5 The major differences between test chewing gums in all three testing phases (figures 11,12 and 13) were the following:

Chewing gum prepared using a one-step according to the invention had a significantly larger volume than corresponding chewing gum prepared in a
10 conventional two-step process.

It can therefore be concluded that the use of a one-step chewing gum process without a separate gum base preparation prior to admixture with the chewing gum additives results in final chewing gum products that, relative to chewing gum processed in two
15 separate mixing steps, are superior with regard to volume.

EXAMPLE 16

**Release of nicotine from conventional medical chewing gum formulation using
20 a one-step mixing process according to the invention**

In this Example, conventional medical gum base formulation was used to make one step chewing gum formulation with 2 mg nicotine. Each of these gum base components was added separately to the mixing apparatus used in the previous
25 examples. For comparison a conventional 2 step process was made with same formulation.

The release of nicotine was measured by in vivo and in vitro analysis.

In vivo release of chewing gums are evaluated according to following scale:

Level	Descripton	Level of nicotine
1	good	nothing
2	good, but	very weak

3	acceptable	"perceptible" - tolerably
4	unacceptable	strong, unpleasant, difficult to tolerate
5	totally unacceptable	to strong, -cannot tolerate

Figure 14 shows the release of nicotine measured in vivo and, as it appears the release of nicotine of the chewing gum made in accordance with the present invention was improved, due to a more acceptable level of nicotine, as compared to the chewing gum made by using the conventional two step process.

Release of nicotine was tested by a HPLC method. The chewing gum was chewed for 10 and 20 minutes in a chewing machine before measurements.

The results of measuring nicotine release in vitro were as listed in the below Table 15:

Table 15. In vitro release of nicotine.

Chewing gum 2 mg nicotine mint	Release nicotine after 10 min chewing	Release nicotine after 20 min chewing
Conventional 2 step process	66,28	84,73
	62,88	84,21
	68,45	83,58
Average	65,87	84,18
One step process	56,23	81,78
	61,82	80,58
	57,08	81,72
Average	58,38	81,36
% difference	11 %	3%

The release results obtained from the in vitro analysis are confirming the in vivo evaluation obtained in the above Example.

CLAIMS

1. A process for preparing a chewing gum, the process comprising charging, in an appropriate order, all of the gum base components and all of the chewing gum
5 additives into a mixing apparatus and operating the apparatus at atmospheric pressure to obtain the chewing gum, subject to the limitation that the gum base does not contain a vinyl polyester as the sole functional chewing gum polymer.
2. A process according to claim 1 wherein at least one component of the gum base is
10 an environmentally degradable or biodegradable polymer.
3. A process according to claim 2 wherein all of the polymeric components of the gum base are environmentally or biodegradable polymers.
- 15 4. A process according to claim 2 or 3 wherein the environmentally or biodegradable polymer is selected from the group consisting of polyesters, polycarbonates, polyester amides, polypeptides and proteins.
5. A process according to claim 1 wherein at least one component of the gum base is
20 a non-degradable polymer.
6. A process according to claim 5 wherein all of the polymeric components of the gum base are non-degradable polymers.
- 25 7. A process according to claim 5 or 6 wherein the non-degradable polymers is selected from the group consisting of polyisobutylene, isobutylene-isoprene copolymer, styrene-butadiene copolymer, polyvinyl acetate (PVA), polyisoprene, polyethylene and vinyl acetate-vinyl laurate copolymer.
- 30 8. A process according to any of claims 1-7, which is a batch mixing process.

9. A process according to claim 8 wherein the mixing apparatus is selected from the group consisting of a sigma blade mixer and an extruder.
10. A process according to any of claims 1-7, which is a continuous process.
- 5 11. A process according to any of claims 1-10 where the resulting chewing gum is formed into pieces and said pieces are coated.
12. A process according to claim 11 wherein the pieces prior to coating are pre-
- 10 coated with at least one layer of a moisture impermeable material.
13. A process according to any of claims 1-12 wherein the temperature in the chewing gum mixture during operation of the mixing apparatus does not exceed about 60°C.
- 15 14. A process according to any of the claims 1-13, wherein the temperature in the chewing gum mixture during operation of the mixing apparatus does not exceed about 48°-55°C.
- 20 15. A process according to any of claims 1-14 wherein the gum base components and/or the chewing gum additives include a pharmaceutically or biologically active substance.
16. A process according to any of claim 15 wherein the pharmaceutically or
- 25 biologically active substance is nicotine.
17. A chewing gum prepared according to the claims 1 -16.
